

As the study of Design develops, we realize that it leads into every field of interest - we have found that by reducing any form to its simplest elements, the charm & the individuality of that form may be interpreted.

Take for instance Animals. All quadrupal animal forms may be reduced in the beginning to one basic structure. It consists of two circles. Join these circles with two lines, as shown

The position & movement of the animal depends on the placing of the neck, head, legs & tail, as already shown in the birds.

Note how the same structure serves for widely different kinds of animals
